# NMT.Model.Embedding

**Embedding** layer encodes words into vector representations.

- Suppose that we have a corpus of  $|V|$  vocabularies, and our hidden dimension for the machine learning model is  $H$ , then the embedding weight dimension should be  $|V| \times H$ .

# NMT.Model.Embedding

**Embedding** layer encodes words into vector representations.

- Suppose that we have a corpus of  $|V|$  vocabularies, and our hidden dimension for the machine learning model is  $H$ , then the embedding weight dimension should be  $|V| \times H$ .
- Ideally, after the training process, words that are semantically similar also have vector representations that are close to each other.
