- Encoder

NMT.Model.Embedding

Embedding layer encodes words into vector representations.

- Suppose that we have a corpus of $|V|$ vocabularies, and our hidden dimension for the machine learning model is H , then the embedding weight dimension should be $|V| \times H$.

NMT.Model.Embedding

Embedding layer encodes words into vector representations.

- Suppose that we have a corpus of $|V|$ vocabularies, and our hidden dimension for the machine learning model is H , then the embedding weight dimension should be $|V| \times H$.
- Ideally, after the training process, words that are semantically similar also have vector representations that are close to each other.

NMT.Model.Encoder
